**ABSTRACT**

We give the solution of the Planck spectrum problem in CMB radiation

**INTRODUCTION**

We continue the discussion of paper two (1.cosmic radiation, CMB ) about the 102nd function of paper one

We use the functions of <http://www.wbabin.net/science/alexandris16.pdf>

**Symbols**

$$m_{eg} = 4,66 \cdot 10^{-9} \cdot \text{kg} = 2.61 \times 10^{18} \cdot \text{GeV}/c^2 \text{ of 5.1a) function (108)}$$

$$m_{eg \text{ k5.1a}} = (2\pi)^{1/2} \cdot m_{eg \text{ k5.1b}} = 2(2\pi)^{1/2} \cdot M_{\text{HAWKING}} ,$$

$m = e/k > 0$  ,  $e+$  : positron electric charge ,  $k_{5.1a} = (G/2\pi \cdot K_e)^{1/2} = (2G \cdot \epsilon_0)^{1/2} = 3,437 \cdot 10^{-11} \cdot \text{Cb/kg}$ ,  $K_e$ : Coulomb constant  $1/4\pi\epsilon_0$   $G$ : gravity constant ,  $\pi = 3.14..$ ,  $c$ : speed of light ,  $\lambda_{\text{plank}}$  : length of plank ,  $h$ : plank constant ,

$l_e$ : radius of Bohr( $a_0$ ) or radius of H ,  $5.29 \times 10^{-11} \cdot \text{m}$  ,  
 $N_a$ : avogadro's number ,  $k_b$ : Boltzman's constant .

**MAIN ARTICLE**

Function 102 of paper one :

$$T = (n_1/n_2)^{-3/2} \cdot N^{-3/2} \cdot 1,085 \times 10^{16} \cdot Q/l_c \quad (1)$$

$$1,085 \times 10^{16} \cdot \text{Kelvin} \cdot \text{Cb}^{-1} \cdot \text{m} = \pi^* \cdot (4\pi)^{-3/4} \cdot \epsilon_0^{-5/4} \cdot G^{-1/4}$$

$$\pi^{*2} = (3,1598199)^2 = 9,9844618 \cdot \text{Cb}^3 \cdot \text{Kelvin}^2 / \text{joule}^2 \cdot \text{kg} = 8,26504 \times 10^{-17} \cdot \text{GeV}^{-1} \cdot e^3$$

$n_1=10$  ,  $n_2=12$  ,  $N=1$  ,  $Q = e$  ,  $l_c$  : length of electric field .

$$\mathbf{T \cdot l_c = 2,2848 \cdot \text{mm} \cdot \text{K}} \quad (2)$$

$T = T_{\text{Boltzman}}$  , temperature of Stefan-Boltzman law without shape

$$\lambda_{\text{max}} = (2\pi)^{1/2} \cdot l_g = 2\pi \cdot l_c \quad , \quad l_g = (2\pi)^{1/2} \cdot l_c$$

$l_g$  is the length of gravity field ,  $\lambda_{\text{max}}$  gives length 1mm in CMB radiation

Three lengths concerns three oscillators of different interactions

$$T \cdot l_g = (2\pi)^{1/2} \cdot 2,28.\text{mm.K} = 5,727.\text{mm.K} = 1,976 \cdot W \quad (3)$$

$W = 2,898\text{mm.K}$  , Wien's constant

$$T \cdot \lambda_{\text{max}} = (2\pi)^{1/2} \cdot 1,976.\text{Wien's constant} = 14,355.\text{mm.K} \quad (4)$$

With Stefan- Boltzman (without shape) temperature  $T_{\text{Boltzman}} = 13,52.\text{K}$  , we get 1mm in CMB radiation

**I believe that 1,976 is a relative coefficient**

$T \cdot l_g \sim 2 \cdot \text{Wien's constant}$

$$T \cdot l_g = (\gamma - 1)c^2/v^2 \cdot 2 \cdot \text{Wien's constant} \quad (5)$$

$$(\gamma - 1)c^2/v^2 = 1/2 \quad , \quad v \ll c$$

function 19 , paper three : surface of shape is  $16.4\pi^2 \cdot l^2$  or  $S = 64\pi^2 \cdot l^2$   
Stefan – Boltzman law gives with that shape, 2,73Kelvin (6)

*Factor of CMB radiation , electron or positron*

Equation 77 , paper one :

$$h^2 \cdot c^2 \cdot G / K_e^3 \cdot k_{bl}^4 = \pi^{*4} \quad (7)$$

Relation of forces in that field

Function 149 paper one :

$$f_c^2 \cdot f_G^1 \cdot f^{*4} = f_e^3 \cdot f_T^4 \quad (8)$$

Relation of interactions

Function 150 paper one :

$$(E/l)_c^2 \cdot (E/l)_G^1 \cdot (E/l)^{*4} = (E/l)_e^3 \cdot (E/l)_T^4 \quad (9)$$

$f_c$  : electromagnetic force ,  $f_G$  : gravitation force ,  
 $f^*$  : remnant force ,  $f_e$  : Coulomb force ,  $f_T$  : thermal force

Function 153 paper one and function 010 paper three :

$$\pi^{*2} = (2\pi)^{1/2} \cdot N^2 \cdot Q^3 \cdot T^2 / (f^{*2} \cdot l^{*2} \cdot m) \quad (10)$$

arises

Function 016 paper three :

$$m^3 = (2\pi)^{1/2} \cdot N^2 \cdot e^3 \cdot T^2 / (\pi^{*2} \cdot c^4) \quad (11)$$

m = mass , e = electric charge of electron or positron , T = temperature,  
 $\pi^* = 3,1598$  with units, c = speed of light, N=1,  $\pi = 3,14...$

If T=2,7325 then we get a mass  $m = 9,84365 \times 10^{-31} \cdot \text{kg} = 0,5521 \text{MeV}/c^2 =$

= mass of the electron + 41,1KeV/c2 (12)

If **m = mass of the electron**, then **T = 2,4325.Kelvin**

Using that temperature, we can see the following equation:

$$2,4325\text{K} \cdot 1,87\text{mm} = 2 \cdot 2,2848 \cdot \text{mm} \cdot \text{K} = 2 \cdot T_{\text{Boltzman}} \cdot l_c, \text{ function (2),} \quad (13)$$

$T_{\text{Boltzman}} = 13,52 \cdot \text{K}$ , function 08-09, paper two

1,87mm is the length of the Planck spectrum in CMB radiation

With function (4) we have:

$$T_{\text{electron}} \cdot L_{\text{plankspectrum}} = 2 \cdot T_{\text{Boltzman}} \cdot l_c = 2 \cdot T_{\text{Boltzman}} \cdot l_g / (2\pi)^{1/2} = \quad (14)$$

$$2 \cdot T_{\text{Boltzman}} \cdot \lambda_{\text{max}} / 2\pi = T_{\text{Boltzman}} \cdot \lambda_{\text{max}} / \pi = 1,976 \cdot (2\pi)^{1/2} \cdot W / \pi \quad (15)$$

$$\text{SO } T_{\text{electron}} \cdot L_{\text{plankspectrum}} / T_{\text{Boltzman}} \cdot \lambda_{\text{max}} = 1/\pi, \lambda_{\text{max}} = \lambda_{\text{CMB}} \quad (16)$$

From (14) , (15) arises

$$T_{\text{Wien's}} \cdot \lambda_{\text{CMB}} / T_{\text{electron}} \cdot L_{\text{plankspectrum}} = \pi / 1,976 \cdot (2\pi)^{1/2} = (2\pi)^{1/2} / 2,1,976 \quad (17)$$

$T_{\text{Wien's}} = 2,7325 \cdot \text{K}$  ,  $\lambda_{\text{CMB}} = 1\text{mm}$  ,  $T_{\text{electron}} = 2,4325 \cdot \text{K}$  ,  $L_{\text{plankspectrum}} = 1,87\text{mm}$ , W:  
Wien's constant

We can see that three laws : Wien's law, Stefan-Boltzman law and The Planck spectrum law are in agreement .

From function (11)  $m > 0$  arises that  $e > 0$  so I believe that the factor is the positron

END

Notes Oct 2009-10-06

Analysis of hypothesis 3, function 110, paper one  
Function 111 ,  $t = \lambda/c$  must be replaced by  $T = 2\pi\lambda/c$  and the case a) must be  
:  $\theta_0 = 1$  ,  $\theta_c = \theta_g = 1$  , to be in agreement with all analysis of my theory  
So in equation a(1) , hypothesis a) is wrong .  
From function 118 arises that  $\lambda = \lambda_{\text{plank}} / 2\pi < \lambda_{\text{plank}}$  , that is not accepted .
